Introduction

→ Fermentation technologies are deeply rooted in the history of most societies;

→ Winemaking environments are characterized by a fascinating genetic diversity of *S. cerevisiae* strains, but population genetic variation is still poorly understood.

Objective

to evaluate populational relationships among *Saccharomyces cerevisiae* strains isolated from some of the Portuguese most important grapevine varieties in different appellations of origin, using polymorphic microsatellites

Materials and Methods

- sampling sites -

Vinho Verde

- Alvarinho
- Loureiro
- Avesso
- Arinto
- Touriga Nacional

Bairrada

- Bical
- Baga
- Maria Gomes
- Aragonês
- Touriga Nacional

Estremadura

- Castelão
- Trincadeira Preta
- Aragonês
- Arinto
- Touriga Nacional

Palmela

- Castelão

Alentejo (sub-region Évora)

- Aragonês
- Trincadeira Preta
- Touriga Nacional

5 Wine Regions
9 Grape varieties
20 Vineyards
6 samples / vineyard

300
grape samples

Materials and Methods

- spontaneous fermentations -

Weight loss of 70 g/l:

Random collection of 30 isolates per fermentatin

Molecular typing

	Minho		Bairrada	Estremadura Palmela Alentejo	Total
	2001-2003	2006	2006	2006	
N° of samples	108	84	60	48	300
Spontaneous fermentations	54	30	29	36	149
Number of isolates	1620	900	870	1080	4470
<i>Saccharomyces</i> sp.	100 %	100 %	100 %	9 %	

Total: 501 *S. cerevisiae* strains

Materials and Methods

Distribution of the most frequent alleles among S. cerevisiae strains from vineyards of the Vinho Verde and Bairrada Regions in 2006

-  Most frequent allele per locus (Minho)
-  Most frequent allele per locus (Bairrada)

Most frequent alleles among *S. cerevisiae* strains from grape varieties of the Vinho Verde and Bairrada Regions

- Alvarinho (30 strains)
- Loureiro (27 strains)
- Avesso (12 strains)
- Arinto (10 strains)
- T. Nacional (5 strains)
(Minho)
- Baga (18 strains)
(vineyard with unique grape variety)
- Baga (14 strains)
(vineyard with several grape variety)
- Aragonês (13 strains)
- T. Nacional (14 strains)
(Bairrada)

Expected (H_e) and observed (H_o) heterozygosity

H_e / H_o

1 - 3

3 - 5

5 - 7

7 - 10

n.d.

(homozygous locus)

Heterozygous genotypes reduction relative to that expected under random mating is a consequence of populational substructuring

Genome renewal

(Mortimer et al., 1994)

Environmental isolates of *S. cerevisiae* undergo mating among their progeny

Multiple heterozygote strain

homozygote strain

*Similarity of S. cerevisiae populations
from distinct wine regions and grape varieties*

Consensus tree of *S. cerevisiae* populations based on F_{ST} genetic distances

Conclusions

→ The finding of 501 *S. cerevisiae* strains reveals a fascinating genetic diversity in vineyard environments.

→ Microsatellite analysis permitted a high resolution populational screen, showing that

genetic differences among *S. cerevisiae* populations derived from both “diagnostic” vineyard-, specific alleles and the accumulation of small allele-frequency differences across ten microsatellite loci;

each vineyard contains differentiated *S. cerevisiae* populations, hypothesizing the occurrence of specific native strains that can be associated with a *terroir*.
